

Genomic Arabidopsis Resource Network

Issue 7

13th June 2001

GARNet's metabolite analysis service at the moment has a back log in carrying out experiments. This is due to the development of new protocols for the different types of analysis being required.

Experiments are being carried out group wise for logistic reasons. For instance if carotenoid analysis is on the programme, all applications that involve carotenoid analysis will get done. This means that if you require more than one type of analysis, you will get your data piecemeal.

We will not stop the possibility to submit applications, because we feel this system works quite well. We hope you understand there is some delay in getting your data. The processing speed of the service will increase as more and more protocols will become available.

all the best,

Karin
